**BRAKE GUARD IS:**

- It is a Safety System with "Anti-Lock" benefits for vehicles with hydraulic brakes.
- It operates automatically, every time the brakes are applied.
- It works to inhibit wheel lock-up, skidding and loss of control when braking.
- It stops vehicles straighter and shorter with better steering control

**HOW BRAKE-GUARD WORKS:**

Heat and other dimensional factors cause brake drums and discs to become slightly egg-shaped or warped. So, when the brakes are applied, the contact surfaces are correspondingly uneven. This in turn causes an unequal transmission of braking effort from the wheels to the roadway resulting in premature wheel lock-up, early brake fade, uneven wear, skidding and loss of control of vehicle.

Like a computer, Brake-Guard's patented system automatically responds to the unequal braking surfaces at each wheel, constantly metering and compensating every time the brakes are applied. The result is an even, constant pressure and uniform coefficient of friction at each wheel through the cycle of rotation, resulting in a smoother, shorter and controlled stopping of the vehicle.
